Release 0.0.1

Philip Schleihau

October 10, 2014

1	Introduction	3
1.1	Contexts	3
1.2	Fields	3
1.3	Cobs ... Things (rename me)	3
2	Tutorial	5
3	Delicious & Nutritious	7
3.1	Kale-Candied Walnut Salad	7
3.2	Pesto Pasta	7
3.3	Green Millet	7

Contents:

Introduction

kale!

1.1 Contexts

heirarchcal (with inheritance and all that). a kind of description of a type.

1.2 Fields

information and functionality that can be attached to contexts

fields are kind of like data types you might set in an SQL schema. but they are much more than that. a field is a python class, and more than that, a field can be *any* python class, but it should conform to certain conventions for sanity's sake.

you can add any new field you'd like to work with kale. field only need to:

have a *raw* property (hint: use the *@property* decortor) which describes its state as an object which can be encoded to json.

be initialized by providing it an object of that *raw* format.

How you structure the raw format is up to you. Go nuts! Stick versioning right into your field, why not?

1.3 Cobs ... Things (rename me)

instances of a given point in a context. instances can exist at the intersection of contexts, and inherit both contexts' fields. n stuf

Tutorial

blah blah blah

Delicious & Nutritious

eat your greens

3.1 Kale-Candied Walnut Salad

- 1 bunch kale, chopped
- 1/2 cup chopped walnut
- 1 red bell pepper, chopped
- 1 large tomato, diced
- Lemon juice
- Olive oil
- Basil
- Sugar

3.2 Pesto Pasta

- Kale
- Basil
- Walnuts (pine nuts if you feel fancy)
- Olive oil
- Salt
- Pepper

3.3 Green Millet
